

Template resolution — `{{name.key}}` then `[token]`

Two stages: AppData lookup on the main thread, per-attach IDs in the worker.

User-authored provider config

```
listenerTopic: /topic/positions/{{user.id}}/[clientTag]
requestBody: {"corr":"[clientTag]","tag":"[corr]"}
websocketUrl: wss://{{infra.host}}:{{infra.port}}
```

① Main thread — useResolvedCfg

resolveCfg(cfg, lookup)

- deep-walks every string in the config
- replaces `{{name.key}}` → `AppData[name][key]`
- AppData mutation → hook re-attaches

When step 1 finishes:

braces gone, `[brackets]` remain.

cfg →

② SharedWorker — startProvider

resolveBracketCfg(cfg, cache)

- fresh BracketCache per startProvider
- `[name]` → 12-char alphanumeric ID
- same `[name]` resolves identically across every field of one config
- stop + re-attach mints a fresh value

Grammar: `/[A-Za-z_][A-Za-z0-9_-]*/` — non-matching tokens (JSON arrays like `[1,2,3]`) are left untouched.
